Preface

Acknowledgments

1	The clumpy universe	1
1.1	Galaxies	1
1.1.1	The Milky Way Galaxy	1
1.1.2	Morphological classification and properties	3
1.1.3	Brightness and magnitude systems	6
1.1.4	Distance estimators	7
1.2	Mapping the universe	12
1.2.1	Redshift surveys	14
1.2.2	Peculiar motions	15
1.3	Selection effects and biases	17
1.3.1	Galaxy obscuration	17
1.3.2	Flux limit, luminosity function, and selection function	17
1.3.3	Segregation	22
1.3.4	Cosmic variance	23
1.3.5	Malmquist bias	23
1.3.6	K-correction	25
1.3.7	Velocity corrections	25
1.4	Current and future galaxy catalogs	26
1.4.1	The galaxy distribution in projection	26
1.4.2	The three-dimensional galaxy distribution	28
1.5	The observed structures: clusters, filaments, walls, and voids	34
1.5.1	Groups and clusters of galaxies	34
1.5.2	Catalogs of clusters of galaxies	37
1.5.3	Superclusters: filaments and walls of galaxies	39
1.5.4	Voids	39
1.5.5	The texture of the galaxy distribution	40
2	The standard model of the universe	43
2.1	Introduction	43

2.2	The Friedmann–Robertson–Walker universe	43
2.2.1	Comoving and physical distances and volumes	44
2.2.2	Hubble’s law and redshift	48
2.2.3	The Friedmann equations	50
2.2.4	Cosmological time	52
2.2.5	The light cone equation	53
2.2.6	Observational distances	55
2.3	Basic observational data	57
2.3.1	Olber’s paradox and the microwave background	59
2.3.2	Isotropy of the matter distribution	60
2.3.3	Homogeneity of the matter distribution	62
2.3.4	Light element abundances	65
2.3.5	The cosmological parameters	67
3	Cosmological point processes	71
3.1	Introduction	71
3.2	Point processes	72
3.2.1	Intensity functions	73
3.2.2	The binomial random field	73
3.2.3	Poisson processes	74
3.3	The relation between discrete and continuous distributions	75
3.3.1	Estimators of the density field: intensity functions	77
3.4	The two-point correlation function	79
3.4.1	Measuring the two-point galaxy correlation function	81
3.4.2	The angular two-point correlation function	97
3.4.3	The correlation integral	98
3.5	N-point correlation functions	101
3.5.1	Hierarchical models for higher-order correlations	103
3.6	Moments and counts in cells	104
3.7	The void probability function	107
3.8	Nearest neighbor distances	108
3.9	Galaxy distribution as a marked point field	110
3.9.1	The normalized mark correlation function	112
4	Fractal properties of the galaxy distribution	115
4.1	Introduction	115
4.2	Fractal models for the universe	116
4.2.1	Rayleigh–Lévy dust	116
4.2.2	Soneira and Peebles fractal model	118
4.3	Tests on projected data	120
4.4	Fractal dimensions	122
4.4.1	Hausdorff dimension	122
4.4.2	Box-counting dimension	124

4.4.3	Correlation dimension	125
4.4.4	Correlation length and fractal behavior	128
4.4.5	Estimators, edge effects, and possible homogenization	131
4.4.6	Mass–radius dimension	133
4.5	Multifractal measures	134
4.6	Multiscaling	138
4.7	Lacunarity	142
5	Statistical and geometrical models	145
5.1	Introduction	145
5.2	The Neyman–Scott process and related models	146
5.2.1	Cox fields	146
5.2.2	Neyman–Scott fields	150
5.3	The Voronoi model	153
5.3.1	Simulating galaxy surveys	156
5.3.2	Spatial interpolation through Voronoi/Delaunay tessellations	159
5.4	Statistical models for the counts in cells	160
5.4.1	The lognormal model	160
5.4.2	The Saslaw distribution function	161
6	Formation of structure	165
6.1	Introduction	165
6.2	Dynamics of structure	165
6.3	The linear approximation	168
6.3.1	Density evolution	168
6.3.2	Velocity evolution	170
6.3.3	Dimensionless growth rate	172
6.3.4	The Zeldovich approximation	173
6.4	Exact solutions	175
6.4.1	Plane-parallel collapse	175
6.4.2	Spherical collapse	177
6.5	Numerical experiments	182
6.5.1	Dynamics of dark matter	182
6.5.2	Gas and galaxies	184
7	Random fields in cosmology	187
7.1	Introduction	187
7.2	Random fields	187
7.2.1	Spatial correlations	188
7.2.2	Fourier representation	191
7.2.3	Power spectrum	192
7.3	Gaussian random fields	194

7.3.1	Filtered fields	195
7.3.2	Spectra of cosmological Gaussian random fields	197
7.4	Realizations of random fields	203
7.4.1	Fourier method	204
7.4.2	Noise convolution	208
7.4.3	Erratic realizations	208
7.5	Non-Gaussian fields	209
7.6	Statistics of peaks in Gaussian random fields	211
7.6.1	Number density of peaks	211
7.6.2	Structure of peaks in Gaussian random fields	216
7.6.3	Clustering of peaks	217
7.6.4	High-peak asymptotics	219
7.6.5	Peak-background split	220
7.6.6	Peak theory and cluster correlations	222
7.6.7	Peak-patch theory	226
7.7	Press-Schechter method	227
7.8	Halo model of galaxy clustering	232
7.9	Stochastic and nonlinear biasing	237
8	Fourier analysis of clustering	241
8.1	Introduction	241
8.2	Estimation of power spectra	242
8.2.1	Direct methods	242
8.2.2	Selection of weights	245
8.2.3	Integral constraint	249
8.2.4	Bayesian and maximum likelihood methods	253
8.2.5	Karhunen-Loève transform	257
8.2.6	Signal-to-noise eigenmodes	258
8.2.7	Quadratic compression	263
8.2.8	Pixelized integral constraint	265
8.3	Redshift distortions	266
8.3.1	General case	267
8.3.2	Far-field approximation	269
8.4	Velocity distortions in power spectrum	272
8.4.1	Fourier-Bessel expansion	273
8.4.2	Modeling the correlation function	275
8.5	Methods for estimating power spectra	277
8.6	Bispectrum	280
8.6.1	Models of the bispectrum	281
8.6.2	Estimation of the bispectrum	283
8.7	Low-dimensional samples	285
8.7.1	Limber's equation	286
8.7.2	Evolution of correlations	288

8.7.3	Power spectra	290
8.7.4	Lucy deconvolution	293
8.7.5	Wide-angle surveys	293
8.7.6	Pencil-beams and slices	295
9	Cosmography	299
9.1	Introduction	299
9.2	Potent method	300
9.3	Wiener filtering	304
9.3.1	Filtering in spherical basis	306
9.3.2	Density interpolation	307
9.3.3	Wiener reconstruction	309
9.3.4	Maps	311
9.3.5	Velocity reconstruction	314
9.4	Constrained fields	319
9.4.1	Constrained realizations for models	321
9.5	Time machines	324
9.6	Gravitational lensing	329
9.6.1	Physics of gravitational lensing	329
9.6.2	Weak lensing	332
9.6.3	Cosmic shear	334
10	Structure statistics	339
10.1	Introduction	339
10.2	Topological description	340
10.2.1	The theory of topological analysis: the genus	340
10.2.2	Estimation of the topology, technicalities	343
10.2.3	Topological measurements: observations	345
10.3	Structure functions	346
10.3.1	Three-dimensional shape statistics	346
10.3.2	Minkowski functionals	348
10.4	Cluster and percolation analysis	351
10.5	Minimal spanning trees	356
10.6	Wavelets	358
10.6.1	Wavelet theory	358
10.6.2	Wavelets and multifractals	360
10.7	Cluster-finding algorithms	362
10.7.1	MST	364
10.7.2	Modified friends-of-friends	364
10.7.3	Wavelets	367
10.8	Void statistics	368
10.9	Checking for periodicity	371

Appendix A	Coordinate transformations	377
A.1	Introduction	377
A.2	The equatorial system	377
A.3	Galactic coordinates	378
A.3.1	The supergalactic coordinates	378
A.4	Coordinate transformations	379
A.5	Sky projections	380
Appendix B	Some basic concepts in statistics	385
B.1	Introduction	385
B.2	General definitions	385
B.3	Estimation	386
B.4	Properties of estimators	387
B.5	Confidence intervals and tests	391
B.5.1	Probability	391
B.5.2	Bayesian methods	391
B.5.3	Confidence intervals	392
B.5.4	Testing hypotheses	394
