

The gravity lagrangian according to solar system experiments

(or Post-Newtonian constraints on $f(R)$ cosmologies)

Gonzalo J. Olmo Alba

University of Wisconsin-Milwaukee

Universidad de Valencia

About this talk . . .

■ Motivation:

Observations indicate that **the cosmic expansion is accelerating**. It seems natural to ask if the cosmic speed-up could be due to new gravitational physics. In particular, **modifications of General Relativity have been proposed**:

$$f(R) = R - \frac{\mu^4}{R}$$

$$f(R) = R + a \ln R$$

$$f(R) = bR^n$$

Theories of this form lead to late-time self-acceleration and suggest that sources of **dark energy could be unnecessary**.

■ Motivation:

Observations indicate that **the cosmic expansion is accelerating**. It seems natural to ask if the cosmic speed-up could be due to new gravitational physics. In particular, **modifications of General Relativity have been proposed**:

$$f(R) = R - \frac{\mu^4}{R}$$

$$f(R) = R + a \ln R$$

$$f(R) = bR^n$$

Theories of this form lead to late-time self-acceleration and suggest that sources of **dark energy could be unnecessary**.

■ Aim:

- ◆ Study if laboratory and solar system experiments can constrain the form of the lagrangian $f(R)$.
- ◆ Answer to:

“May the cosmic speed-up be due to $f(R)$ gravities?”

$$f'(R)R_{\mu\nu}(\Gamma) - \frac{1}{2}f(R)g_{\mu\nu} - \nabla_\mu \nabla_\nu f'(R) + g_{\mu\nu} \square f'(R) = \kappa^2 T_{\mu\nu}$$

$$\Gamma_{\beta\gamma}^\alpha = \frac{g^{\alpha\rho}}{2} [\partial_\beta g_{\rho\gamma} + \partial_\gamma g_{\rho\beta} - \partial_\rho g_{\beta\gamma}]$$

- Both formalisms naturally lead to cosmic speed-up.
- We must determine the right formalism and the function $f(R)$.

- If $l \equiv$ lengthscale at which the nonlinearities manifest then

$$\diamond f(R) \leq \alpha + \frac{l^2 R^2}{2} + \frac{R}{2} \sqrt{(f'_0)^2 + (l^2 R)^2} + \frac{f'_0}{2l^2} \log[l^2 R + \sqrt{1 + (l^2 R)^2}]$$

$$\diamond f(R) \geq \alpha - \frac{l^2 R^2}{2} + \frac{R}{2} \sqrt{(f'_0)^2 + (l^2 R)^2} + \frac{f'_0}{2l^2} \log[l^2 R + \sqrt{1 + (l^2 R)^2}]$$

for $f'' > 0$ and $f'' < 0$ respectively.

- In the limit $l^2 R \ll 1 \rightarrow \alpha + R - \frac{l^2 R^2}{2} \leq f(R) \leq \alpha + R + \frac{l^2 R^2}{2}$

Analysis

■ Metric formalism:

- ◆ The cosmic-speed up, if due to the effects of nonlinear terms, would have modified $l_\phi \sim m_\phi^{-1}$ and affected the dynamics of the solar system, globular clusters, galaxies,...
- ◆ To prevent the growth of m_ϕ^{-1} with the expansion in order to satisfy the current experimental tests:

$$-2\Lambda \leq f(R) \leq R - 2\Lambda + \frac{l^2 R^2}{2}$$

- **Conclusion:** at low R the lagrangian is almost linear and bounded quadratically in R . **Nonlinear terms dominating at low R cannot be responsible for the cosmic speed-up.**
