K4-FREE GRAPHS AS A FREE ALGEBRA

42nd International Symposium on
Mathematical Foundations of Computer Science
Aalborg, 2017

E. Cosme, D. Pous

Laboratoire de l'Informatique du Parallélisme
École Normale Supérieure de Lyon

Algebras of relations appear naturally in many contexts in computer science as they constitute a framework well suited to the semantics of imperative programs.

Many objects of interest either are relations or can be seen as relations. A major benefit of a relational approach in computer science is the surprisingly small number of relations needed to express complex notions.

SYNTAX

We consider algebras of the following type

$$u, v ::= u \cdot v \mid u \parallel v \mid u^\circ \mid 1 \mid \top \mid a \quad (a \in \Sigma).$$

SYNTAX

We consider algebras of the following type

$$u, v ::= u \cdot v \mid u \parallel v \mid u^\circ \mid 1 \mid \top \mid a \quad (a \in \Sigma).$$

One model for this algebra is the set of relations on a given set with the usual interpretation of the operators.

TERMS AS GRAPHS

TERMS AS GRAPHS

ASSOCIATED GRAPH

$$g(a) \triangleq \rightarrow \textcircled{} \xrightarrow{a} \textcircled{} \rightarrow$$

$$g(u^\circ) \triangleq \rightarrow \textcircled{} \xleftarrow{g(u)} \textcircled{} \rightarrow$$

$$g(\top) \triangleq \rightarrow \textcircled{} \quad \textcircled{} \rightarrow$$

$$g(u \parallel v) \triangleq \rightarrow \textcircled{} \begin{array}{c} \xrightarrow{g(u)} \\ \xleftarrow{g(v)} \end{array} \textcircled{} \rightarrow$$

$$g(1) \triangleq \rightarrow \textcircled{} \rightarrow$$

$$g(u \cdot v) \triangleq \rightarrow \textcircled{} \xrightarrow{g(u)} \textcircled{} \xrightarrow{g(v)} \textcircled{} \rightarrow$$

Terms \xrightarrow{g} Graphs

Theorem [FS90]

For any terms u, v , we have

$$\text{Rel} \models u \subseteq v \quad \Leftrightarrow \quad g(u) \blacktriangleleft g(v).$$

Theorem [FS90]

For any terms u, v , we have

$$\text{Rel} \models u \subseteq v \quad \Leftrightarrow \quad g(u) \blacktriangleleft g(v).$$

Example

$$\text{Rel} \models a \cdot (b^\circ \cap c) \cap d \subseteq (a \cap a) \cdot b^\circ \cap a \cdot c$$

Example

$$g((a \cdot b \parallel c^2 \parallel e) \cdot d \cdot (1 \parallel a^\circ \cdot \top))$$

$$g(1 \parallel a \cdot (b \parallel c^\circ) \cdot d \cdot e^\circ)$$

$$g(\top \cdot a \cdot \top \cdot b \cdot \top) \cong g(\top \cdot b \cdot \top \cdot a \cdot \top)$$

It is not a term graph [FS90]

TREE DECOMPOSITION

Example

The width of a tree decomposition is the size of the largest node minus one. The treewidth of a graph is the minimal width of a tree decomposition for this graph.

Bounded treewidth can be described by minor exclusion.

Bounded treewidth can be described by minor exclusion.

Proposition

Every term graph has treewidth bounded by 2 with one node containing input and output.

$$\text{Term} \xrightarrow{g} TW_2$$

Example

$$g((a \cdot b \parallel c^2 \parallel e) \cdot d \cdot (1 \parallel a^\circ \cdot \top))$$

$$g(1 \parallel a \cdot (b \parallel c^\circ) \cdot d \cdot e^\circ)$$

$$g(\top \cdot a \cdot \top \cdot b \cdot \top) \cong g(\top \cdot b \cdot \top \cdot a \cdot \top)$$

It is not a term graph [FS90]

Example

No such tree decomposition

Example

No such tree decomposition

Extract a term from a graph with compatible input and output.

CASE 1: CONNECTED WITH INPUT DIFFERENT FROM OUTPUT

Example

Case 1.1

Case 1.2

CASE 2: CONNECTED WITH INPUT EQUALS OUTPUT

Example

$$1 \parallel u \cdot \top$$

CASE 3: DISCONNECTED

Example

 $\top \cdot u$

Disconnects the input.

 $u \cdot \top$

Disconnects the output.

Theorem

For any 2-pointed graph G with compatible input and output,

$$g(t(G)) \cong G.$$

Theorem

For any 2-pointed graph G with compatible input and output,

$$g(t(G)) \cong G.$$

Corollary

Let G be a graph. The following statements are equivalent.

1. G is a term graph.
2. G has treewidth bounded by 2.
3. G is K_4 minor free.

In the definition of the associated term, some choices were made. Up to these choices, the term we extracted represents the same graph up to isomorphism.

In the definition of the associated term, some choices were made. Up to these choices, the term we extracted represents the same graph up to isomorphism.

1. $G \cong H$ implies $t(G) \equiv t(H)$
2. $u \equiv t(g(u))$

In the definition of the associated term, some choices were made. Up to these choices, the term we extracted represents the same graph up to isomorphism.

1. $G \cong H$ implies $t(G) \equiv t(H)$
2. $u \equiv t(g(u))$

The reduct (\parallel, \top) is a commutative monoid, the reduct $(\cdot, 1)$ is a monoid. The converse $^\circ$ is an involution.

$$1 \parallel 1 \equiv 1$$

$$u \cdot (1 \parallel v) \equiv u \parallel \top \cdot (1 \parallel v)$$

$$1 \parallel u \cdot v \equiv 1 \parallel (u \parallel v^\circ) \cdot \top$$

$$u \cdot \top \parallel v \equiv (1 \parallel u \cdot \top) \cdot v$$

The reduct (\parallel, \top) is a commutative monoid, the reduct $(\cdot, 1)$ is a monoid. The converse $^\circ$ is an involution.

$$1 \parallel 1 \equiv 1$$

$$u \cdot (1 \parallel v) \equiv u \parallel \top \cdot (1 \parallel v)$$

$$1 \parallel u \cdot v \equiv 1 \parallel (u \parallel v^\circ) \cdot \top$$

$$u \cdot \top \parallel v \equiv (1 \parallel u \cdot \top) \cdot v$$

Theorem

The axioms listed above give a complete axiomatisation of isomorphism of graphs of treewidth bounded by 2.

TW_2 / \cong is a free algebra.
