Table S2. Fire activity by ecoregion. For each ecoregion we show the biome, the fire activity index (from 0 to 1), the coefficient of the monthly Fire Activity Index against the monthly maximum temperature (Coef; an indicator of the climatic sensitivity of fire), and the associated p-value. Ecoregion codes following the international nomenclature; biome codes are described in Table 1 (of the main text). NA: not available.

Ecoregion	Biome	Fire Activity	Coef	pval

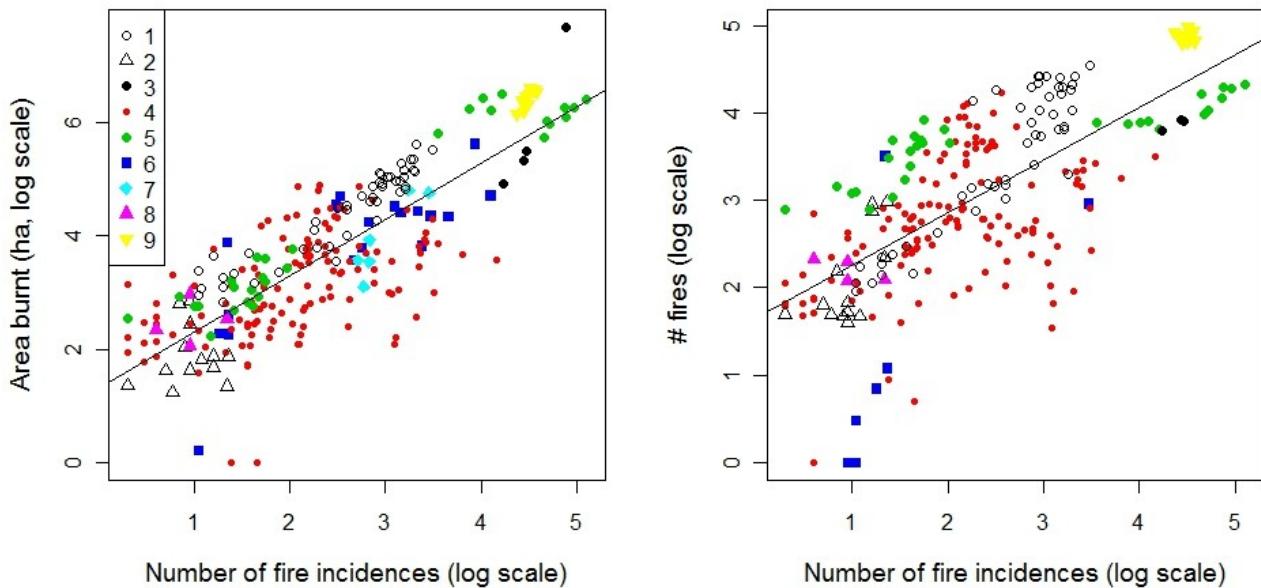

Figure S1. Relation of area burned (ha, left) and number of fires (right) against remotely sensed fire activity (x-axes), for 45 and 37 countries (respectively); note that axes are at log scale (source of the fire data in Table S1). Fire activity corresponds to the corrected number of fire incidences depicted by the MODIS sensor (Terra satellite) in each country. Different colors (coded from 1 to 9 in the left pannel) refers to the dominant biome of the country (1: Med, 2: TempConif, 3: Desert, 4: TempBroad, 5: Taiga, 6: TrMoist, 7: TrConif, 8: Tundra, 9: TempGrass; full names are in Table 1). The correlations are highly significant ($r= 0.815$ and 0.686 , respectively, $p< 0.0001$); the linear mixed-effect model with country as random factor (i.e., repeated measures analysis) were also significant ($\chi^2 = 113.52$ and 50.62 , respectively, $df=1$, $p< 0.0001$). In other words, the remotely sensed fire activity from MODIS is a good indicator of the observed fire activity in the field.

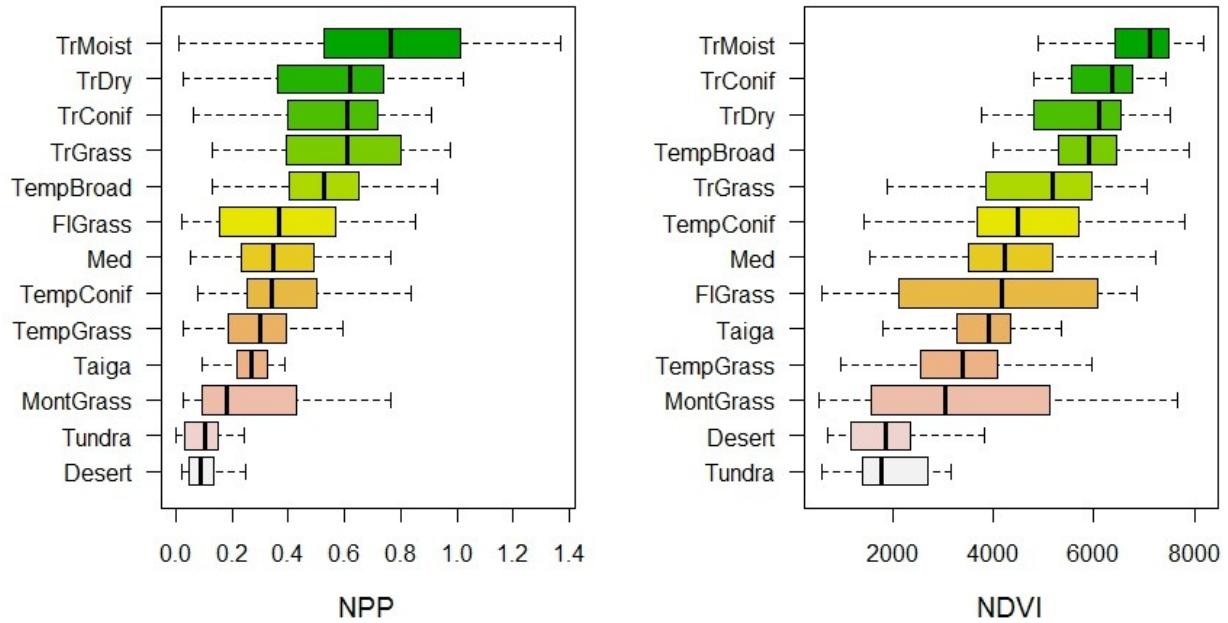

Figure S2. Summary of the productivity variables by biome; variability correspond to the ecoregions of each biome. In each plot biomes are ordered by median value of the variable considered. NPP: Net Primary Production (Gigagrams/Km²); NDVI: Normalized Differences Vegetation Index. Biome codes as in Table 1.

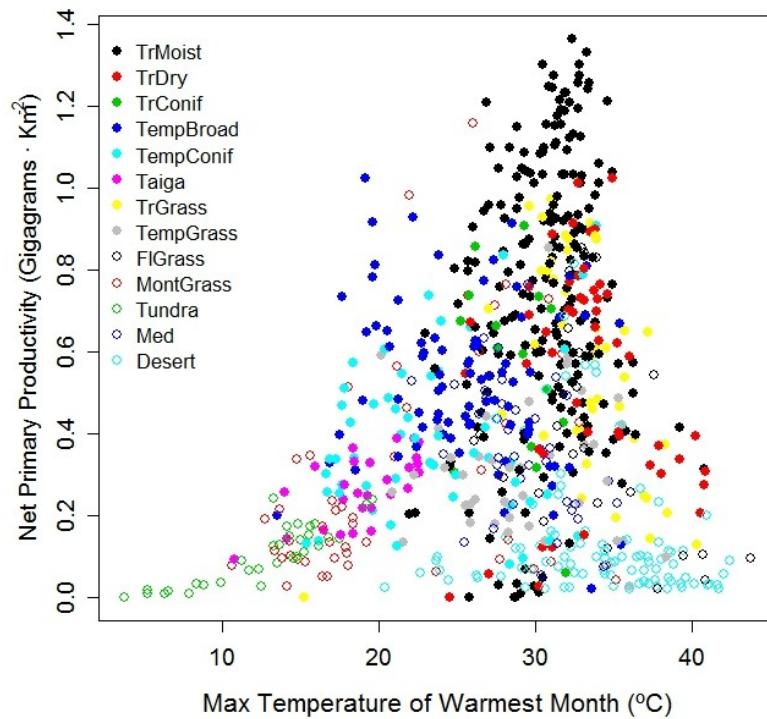

Figure S3. Distribution of the different ecoregions in relation to the maximum temperature of the warmest month and the net primary productivity. Colors refer to different biomes (code as in Table 1).

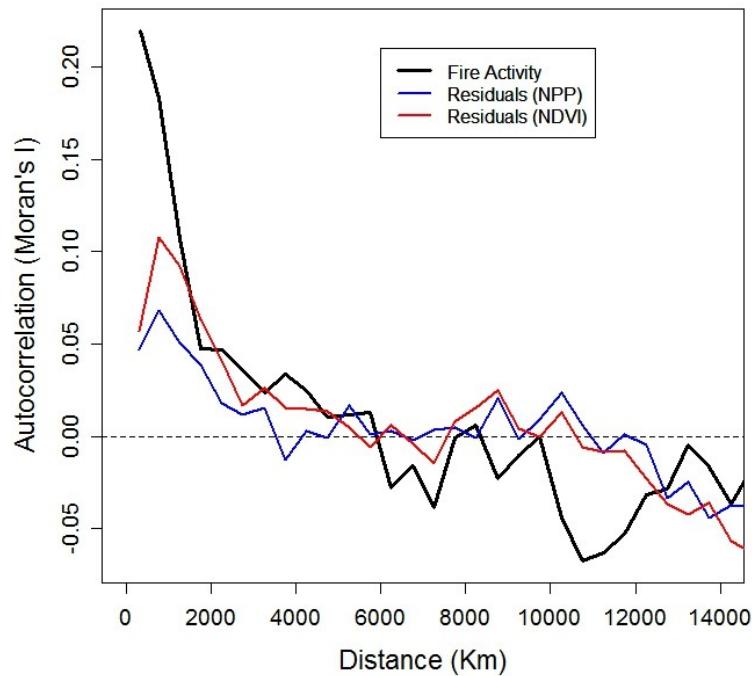

Figure S4. Spatial autocorrelograms (Moran's I coefficient in relation to the geographical distance) of fire activity (thick black line) as well as of the residuals of the GAM models (Figure 3) with the productivity predictors.

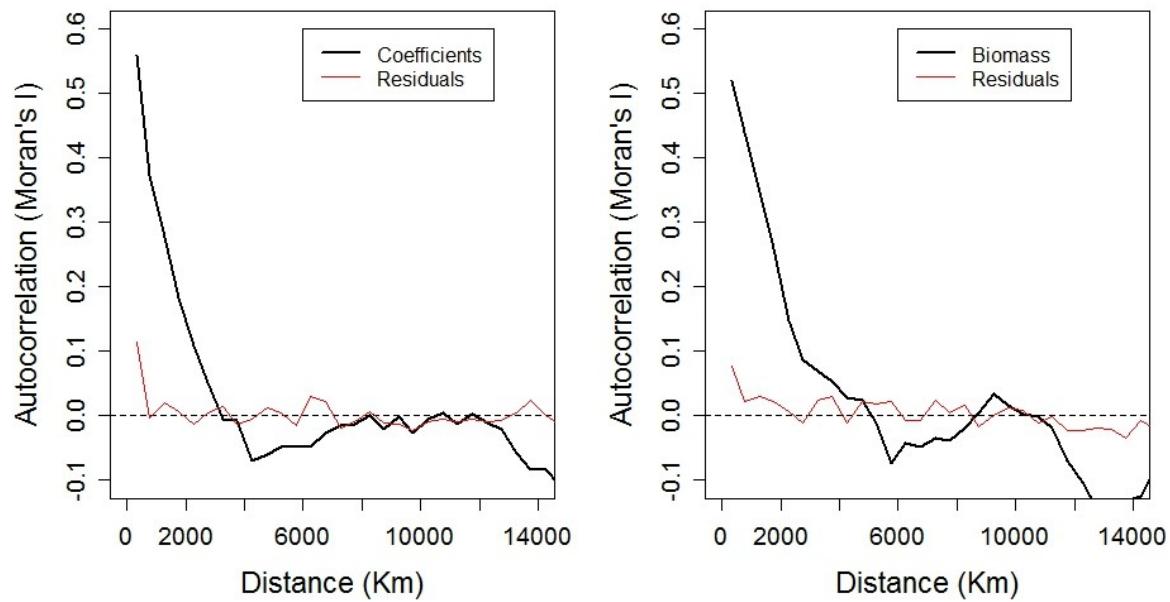

Figure S5. Spatial autocorrelograms (Moran's I coefficient in relation to the geographical distance) of a) the coefficients relating monthly fire activity and monthly maximum temperature and of the residuals of these coefficients against NPP (Fig. 4 left); and b) biomass and the residuals of the biomass against NPP (Fig. 4 right).
