Tratamiento farmacológico CVasc en p. con edad avanzada

- Los fármacos CVasc son los más frecuentemente prescritos.
- Suelen tener estrecho margen terapeutico: Efectos Adversos.
- Su uso apropiado requiere conocer:
 - Cambios de la fisiología relacionados con la edad.
 - Comorbilidades que alteren la FK y FD de los fármacos.
 - Interacciones medicamentosas.

Distribución de los fármacos: Cambios con la edad

< masa corporal total. >proporción de grasa corporal.

> Vd de drogas liposolubles.

< Betabloqueantes

< proporción de agua corporal.

< Vd de drogas hidrosolubles.

> Digoxina y IECAs

< albúmina plasm.

< perfusión tejidos.

> % droga libre

< Vd.

> Acenocumarol

Metabolismo y Excreción de fármacos: Cambios con la edad

Hígado: < masa, flujo sang. y capacidad metabólica.

Acumulación de drogas metabolizadas en hígado.

> Acenocumarol, propranolol, nitratos, diltiazem, verapamil. **Riñón**: < filtración glomerular, función tubular y flujo sanguíneo.

Acumulación de drogas eliminadas por el riñón.

> Digoxina, atenolol, antiarrítmicos, IECAs.

Cambios en la farmacodinámica con la edad

< sensibilidad de los barorreceptores Tendencia a Hipotensión Ortostática

< respuesta cardiaca y vascular de recept. ß < efecto betabloqueante

> Sensibilidad a anticoagulantes > efecto del acenocumarol

Comorbilidades > interacciones fármaco-enfermedad

Polifarmacia > interacciones fármaco-fármaco

Disfunción sinusal y del nodo AV Tendencia al bloqueo cardiaco

Fármacos culpables de síntomas frecuentes en edad avanzada

Estados confusionales Digoxina, betabloqueantes

Vértigo, tinnitus Aspirina, Furosemida

Depresión Betabloqueantes

Caídas Nitratos, fármacos productores de hipotensión postural

Hipotensión postural Antihipertensivos, antianginosos, betabloq., diuréticos

Estreñimiento Diltiazem, Verapamil, Diuréticos

Incontinencia urinaria Betabloqueantes, Diuréticos

Interacciones fármaco-enfermedad en edad avanzada

Enfermedad	<u>Fármacos</u>	Efecto Adverso
ICC	Verapamil	Descompensación IC aguda
Alter. Conducción Antidepres. Tricíclicos		oqueo Cardiaco
Hipertensión	AINES	Aumento de Presión Arterial
Arteriop. Per. Crón.	Betabloqueantes	Claudicación Intermitente
EPOC	Betabloqueantes	Broncoconstricción
IRC	AINES	Insuf. Renal Aguda
Diabetes	Diuréticos	Hiperglucemia
Depresión	Betabloqueantes	Exacerban la Depresión
Hipokaliemia	Digoxina	Arritmias cardiacas
Ulcera Péptica	ACO, NACO, Salicilatos	Hemorragia Gastrointestinal

Table 1. Selection of Antihypertensive Therapy for Older Adults Based on Comorbidities

Compelling Indication Initial Therapeutic Choice			
Heart failure	Thiazide, β-blocker, ACE inhibitor, angiotensin receptor antagonist, calcium channel blocker, aldosterone antagonist		
Previous myocardial infarction	β -Blocker, ACE inhibitor, aldosterone antagonist, angiotensin receptor antagonist		
CHD or high-risk CVD	Thiazide, β-blocker, ACE inhibitor, calcium channel blocker		
Angina pectoris	β-Blocker, calcium channel blocker		
Aortopathy/aortic aneurysm	β -Blocker, angiotensin receptor antagonist, ACE inhibitor, thiazide, calcium channel blocker		
Diabetes mellitus	ACE inhibitor, angiotensin receptor antagonist, calcium channel blocker, thiazide, β -blocker		
Chronic kidney disease	ACE inhibitor, angiotensin receptor antagonist		
Recurrent stroke prevention	Thiazide, ACE inhibitor, angiotensin receptor antagonist, calcium channel blocker		
Early dementia	Blood pressure control		

Most patients will require combination therapy. ACE indicates angiotensin-converting enzyme; CHD, coronary heart disease; and CVD, cardiovascular disease. Adapted from Aronow et al³⁷ with permission. © 2011, American Heart Association, Inc.

Table 3. Common latrogenic Effects of Secondary Prevention Medications in Older Patients With ASCVD

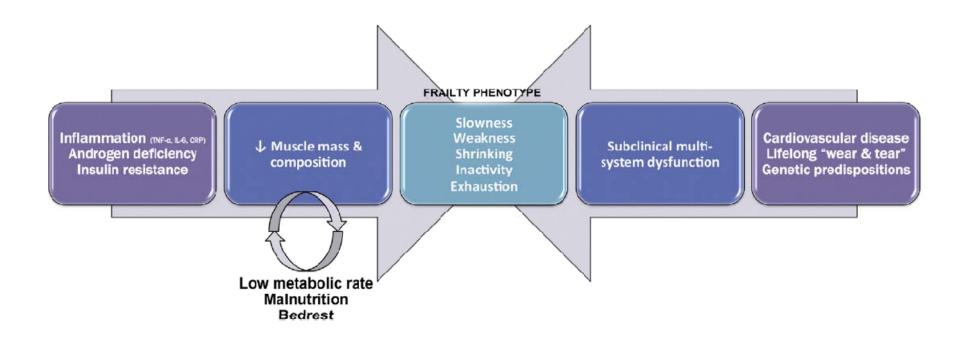

Medication Class	Medication	General Side Effects in Older Cardiac Patients	Medication-Medication Side Effects	Comorbid Disease–Medication Interactions
Anti-ischemics and antihypertensives	β-Blockers	 Confusion, fatigue, dizziness, bronchospasm, conduction block, chronotropic incompetence, claudication, depression, cold sensitivity, incontinence Hypoglycemia Increased system absorption in body fat, with delayed metabolism 	 Calcium channel blockers: conduction disease and chronotropic incompetence Sulfonylureas: hypoglycemia 	 COPD: bronchospasm Depression or anxiety: \(\)fatigue and depression PAD: claudication Raynaud syndrome: \(\)\(\)symptoms CHF: acute decompensation Conduction disease: bradycardia, heart block
	ACE inhibitors	 Falls, dizziness, hypotension (orthostatic, postprandial), hyperkalemia, fatigue, azotemia, cough 	 Diuretics (and other antihypertensives): †susceptibility to hypotension NSAIDs: †susceptibility to renal failure 	 CKD: hyperkalemia and \(\gamma\)renal failure
	Nitrates	Dizziness, hypotension, syncope, headache	 Diuretics: hypotension and low cardiac output Phosphodiesterase inhibitors: severe hypotension Alcohol: hypotension 	Aortic stenosis: hypotension
	Diuretics	 Urinary frequency and incontinence, electrolyte 	 ACE inhibitors and other diuretics: hypotension 	CKD: ↑renal failureDiabetes mellitus:

Recom. de la AHA. Fleg JL y cols. Circulation 2013;128:2422-2446

Table 3. Common latrogenic Effects of Secondary Prevention Medications in Older Patients With ASCVD

Medication Class	Medication	General Side Effects in Older Cardiac Patients	Medication-Medication Side Effects	Comorbid Disease–Medication Interactions
	Calcium channel blockers	 Dizziness, flushing, and peripheral edema (dihydropyridines), constipation (verapamil) 	 β-Blockers: conduction disease and chronotropic incompetence 	 CHF: decompensation Conduction disease: bradycardia, heart block
Antiplatelet	Aspirin	GI bleeding, dyspepsia, tinnitus, skin reactions	 Warfarin, direct thrombin inhibitors, or thienopyridine: †bleeding 	 GI bleeding history, hypertension: †bleeding risks
	Thienopyridines	Gl bleeding, bruising, rash	 Warfarin and ASA: †bleeding. 	 Gl bleeding history, anticipated surgery: †bleeding risks
Cholesterol reduction	Statins	Myalgias, confusion, renal insufficiency, liver toxicity	 Meds metabolized by the cytochrome P450 system (fibrates, amiodarone, erythromycin, diltiazem, azole antifungals): ↑statin levels and ↑levels of the other meds Grapefruit juice: ↑statin levels (via cytochrome P450 mechanism) Fibric acids: myopathy (gemfibrazole>fenofibrate) 	 Hypothyroidism, CKD, diabetes mellitus: †susceptibility to statin-induced myopathy
	Fibric acids	Nausea, liver toxicity, gallstones	Statins: myopathyWarfarin: †warfarin levels	CKD: ↑renal failure

Two of the Pathways Leading Toward the Phenotype of Frailty

Pasos para asegurar una prescripción cuidadosa

- Historia completa de hábitos y medicación del paciente.
- Considerar alternativas no farmacológicas.
- Comenzar con dosis baja y titular el fármaco lentamente.
- Titulación del fármaco adaptada a la respuesta del paciente.
- Minimizar el número de medicamentos a prescribir.
- Educar al paciente o cuidador sobre el uso apropiado de los fárm.
- Valorar coste: impacto sobre el cumplimiento.
- Insistir en listado de fármacos siempre con el paciente.
- Revisar tratamiento regularmente y retirar fármacos no precisos.

Recom. de la AHA. Fleg JL y cols. Circulation 2013;128:2422-2446
