SUMMARY

The management and conservation of species and their habitats is a very important part of Conservation Biology. Conservation Biology, also called Conservation Science, is a multidisciplinary science that focuses on the study of nature and biological diversity with the aim of protecting species, their diversity at all levels, their habitats, ecosystems and the communities in which they live. Conservation Biology is a crisis discipline that tries to unite the interaction between ecological theory and other biological, physical and social sciences, as well as with the policies and practice of biodiversity conservation, in a multiscale field that goes from individual genetic diversity, intrapopulation diversity, to the biosphere as a whole, and postulates actions that can also take place at different spatial and temporal scales. The current extinction crisis, accentuated by the rapid changes linked to global change, is leading to the disappearance of part of the planet's biodiversity. In this global context, the Management and Conservation of Species and their Habitats deals with the phenomena that affect the maintenance and loss of biodiversity, as well as the processes that generate genetic, population, taxonomic and ecosystem diversity. Increasingly, the Management and Conservation of Species and their Habitats interacts with the eco-sociological framework in which these processes occur, and tries to provide a global response to the current biodiversity crisis based on deep scientific knowledge, but also in an ethical attitude towards life.

The subject "Management and Conservation of Species and Habitats", corresponding to module VI "Conservation, Planning and Management of the Environment" of the Study Plan of the Degree in Environmental Sciences. The subject is articulated with the rest of the subjects of the module and with those studied previously in the first two years of the degree, so that the intensification, coordination and complementarity with the rest of the subjects allows the student to be given an integrated vision of the knowledge and to promote the necessary capacities to face the problem of the conservation of biological diversity in all its facets.

PREVIOUS KNOWLEDGE

RELATIONSHIP TO OTHER SUBJECTS OF THE SAME DEGREE

There are no specified enrollment restrictions with other subjects of the curriculum.

OTHER REQUIREMENTS

To be enrolled in all subjects of the modules "General Scientific Basis" and "Scientific bases of the natural environment"

COMPETENCES / LEARNING OUTCOMES

1104 - Degree in Environmental Sciences

Capacidad para elaborar planes de gestión de poblaciones amenazadas de flora y fauna.

Capacidad para reconocer el estado e importancia de la biodiversidad y valorar sus principales amenazas.

Conocer los conceptos, y capacidad para aplicar estrategias y modelos encaminados a la gestión y conservación de los recursos bióticos, al manejo de poblaciones y especies amenazadas, y de hábitats de interés prioritario.

Conocimiento y capacidad de valoración de la importancia de los aspectos socioeconómicos en la gestión y planificación de los recursos naturales abióticos y bióticos.

DESCRIPTION OF CONTENTS

0. PRESENTATION OF THE SUBJECT

Teaching organization of the subject. Teachers, their profile; how to contact them. Teaching materials. Topics for work and seminars.

**1. BLOCK I. CONSERVATION BIOLOGY: STATUS AND THREATS TO BIODIVERSITY**

Theme 1. Biodiversity. What is biodiversity and why is it important? Components of biodiversity. How many species exist? Diversity of higher taxa. Diversity of communities. Diversity of ecosystems and biomes.

Theme 2. Patterns of biodiversity. Species richness throughout history. Patterns of endemism. Latitudinal gradients in species richness. Relationships between species richness and the energy available in the ecosystem. Disturbances and species richness.

Theme 3. Value of biodiversity. Green economy and direct economic values. Indirect economic values. Ethical values.

Theme 4. Extinction. Extinction episodes in the past. Cretaceous-Tertiary extinctions. Extinctions in the Permian. Man-made extinctions. Estimates of current extinction rates. Current threat patterns. Vulnerability to extinction. Conservation categories.

Theme 5. Threats to biodiversity. Major threats and their interactions. Habitat destruction, degradation and fragmentation. Overexploitation. Invasive species and diseases.

Theme 6. Biological impacts of climate change. Nature of climate change. Current and future climate change. Possible biological impacts. Observed biological impacts. Implications for conservation.

Item 7. Conservation genetics. Genetic variability. Forces affecting genetic variability. Conservation units. Application of genetics to species management.

Theme 8. Problems of small populations. Minimum viable populations and minimum dynamic area. Loss of genetic variability. Demographic stochasticity. Environmental stochasticity and catastrophes. Vortices of extinction.

Theme 9. Population ecology and population viability. Mechanisms for regulating populations. Metapopulations. Population viability analysis. Long-term population monitoring.

10 hours

Lesson 10. International approaches to conservation. International organizations. Non-Governmental Organizations (NGOs). Legislation and international agreements on biodiversity. Legislation and regulations of the European Union and state.

Lesson 11. Legislation of the European Union relative to habitats and natural spaces. The Habitats Directive. The Natura 2000 Network. Special Conservation Areas (ZECs), Sites of Community Interest (LICs) and Special Protection Areas for Birds (ZEPAs). Types of Natural Habitats of community interest. Priority habitats. State and Valencian Community legislation on habitats.

Lesson 12. Legislation of the European Union relative to the fauna. The Birds Directive of the European Union. State legislation related to fauna. Legislation of the Valencian Community regarding fauna. Wildlife reserves.

**WORKLOAD****PRESENCIAL ACTIVITIES**

Activity	Hours
Tutorials	3,00
Theory	36,00
Laboratory	15,00
Computer classroom practice	6,00
Total hours	60,00

NON PRESENCIAL ACTIVITIES

Activity	Hours
Attendance at other activities	2,00
Individual or group project	20,00
Independent study and work	25,00
Preparation of lessons	30,00
Preparation for assessment activities	3,00
Resolution of case studies	10,00
Total hours	90,00

TEACHING METHODOLOGY**PRACTICAL SESSIONS****Field practices**

Field trips are an essential teaching resource in the subject. For its development, a close and varied geographical environment will be chosen in environments (e.g., coastal wetlands), in which certain aspects of the conservation of biological complexity will be addressed at its different levels of organization, covering both biological and related aspects. with other environmental sciences, including the basic eco-sociological and legal aspects, as well as the application of the necessary techniques for it.

They will be articulated with the practices to be carried out in the computer room. There may be both short-term outings (1 day), as well as somewhat longer ones (2 days), depending on the logistical availability and the development of the teaching program. The duration of the field practices is estimated at around 15 face-to-face teaching hours.

Informatics practices.

They will overlap with the field trips, once the course has advanced to facilitate the students' understanding of the concepts of the first block of the subject, especially with regard to the theoretical aspects addressed in Units 7, 8 and 9 of the subject. To do this, three sessions will be held in the computer room of the Faculty of Biology in which students will carry out a Population Viability Analysis (PVA) using the Vortex 10.x program. In this analysis, students will put into practice the concepts of extinction risk, environmental, demographic and genetic stochasticity, and aspects related to the dynamics of metapopulations applied to the field of conservation biology. Specifically, PVAs will be carried out based on real cases with species of conservation interest such as Bonelli's eagle (*Aquila fasciata*) and Audouin's gull (*Ichthyaetus audouinii*).

Attendance at the practice sessions is mandatory, and the teacher will take the roll call to verify it.

SEMINARS (INVITED AND GROUP PRESENTATION)

Throughout the course, three one-hour seminars will be held for guest speakers who can provide a practical point of view regarding the development of any aspect of the agenda, where students will be able to interact with researchers from other research centers as well as with professionals in the field of Environmental Sciences who carry out their professional activity linked to the field of management and conservation of species and habitats who work in the administration, in non-governmental entities or in the field of the private sector. Students must submit through the Virtual Classroom a brief summary of the exposed contents, their critical opinion and the relationship that the seminar has had with the theoretical contents of the subject.

GROUP TUTORING

During the course there will be three sessions of one hour of group tutoring. They will present and discuss various aspects related to the subject. In the first session, all the logistics of leaving the field practices will be explained. In the following two sessions, the teacher will either solve specific doubts that have arisen during the course of the subject or present a practical case as a question that may appear in the theory exam in which the students must present their reflections and critical view of the subject based on previously acquired knowledge. Attendance at tutorials is mandatory and the teacher will take a roll call to verify attendance.

PERSONALIZED TUTORING

The teacher will indicate an attendance schedule for the student, which they can use whenever they consider it necessary. Within this schedule it is planned that students, individually, can attend during the semester to resolve specific questions or doubts about the contents of the subject.

PREPARATION OF THE THEORY CLASSES

The time that the student must dedicate to the advance preparation of the theory sessions is counted here. The didactic material (projections and script of the topic) of each theory session will be available in the Virtual Classroom (<https://aulavirtual.uv.es/>) at least 48 hours before the session takes place.

STUDY AND EXAM PREPARATION

Student independent study.

CONDUCT OF EXAMS

A final test will be held at the end of the semester. This final test will include questions from the theoretical and practical parts of the subject. It will not be possible to have materials and notes in the execution of the exams except for a calculator. If necessary, the teacher will provide a form.

>

EVALUATION

MODE OF EVALUATION

1. Objective test consisting of a two-hour exam that will include multiple choice questions, short questions, development questions and problems seen in the computer sessions. The percentage of the final grade for this test will be 65%.
 2. Evaluation of the practical activities (i.e., tasks) based on the preparation of reports of computer practices, report of field practices, delivery of at least one summary of the seminars by invited speakers and the presentation of the group seminar . The percentage of the final grade for these tests will be 25%.
-
1. Continuous evaluation of each student, based on attendance, participation in class and degree of involvement in the teaching-learning process. The percentage of the final grade for these tests will be 10%.

The mark of the subject in each call will be global, calculated by adding the marks of the previous sections. To obtain the overall grade, the final exam must be passed with at least 50% of the maximum grade. For the rest of the sections (i.e., homework and attendance/participation) it may be averaged for the final calculation of the grade if the student has obtained at least 40% of the maximum grade.

In case of not passing the subject in the first call of the academic year, the marks of those parts of the subject (among the three outlined above) in which at least 50% of the score has been obtained will be saved for the second call. within the same academic year. In no case will any of these grades be saved for the

following academic year.

The notes that imply the assistance and delivery of a memory for its evaluation, will be qualified, both in the first and in the second call, if it has been attended. If they have not attended, they will be scored with zero points in the corresponding sections.

To request advance notice of this subject, students must take into account that they must have completed the compulsory activities indicated in the teaching guide for the subject.
