SUMMARY

Pharmacognosy with 9 ECTS (6 credits in the first semester and 3 credits in the second), is given annually in the third year of degree in pharmacy. This subject is a branch of Pharmacological Sciences that has a long tradition in the Pharmacy studies, and brings to the student the knowledge on the **materials of biological origin** (crude drugs) obtained from **plants, animals or microorganisms**, both terrestrial and marine, useful for obtain medicines. Its development, like other sciences has experienced periods of great splendor with other ones slow progress. Currently there is a great interest in such natural sources, because they furnish from the secondary metabolism a large number of compounds that are difficult and/or commercially less profitable and sustainable to produce by synthesis. In this sense, it is worth highlighting the importance of innovations in sustainable agronomy, highlighting the possibility of using biopesticides obtained from the geographical environment itself. Furthermore, certain secondary metabolites are subject to semisynthetic change to become more effective or less toxic drugs. It is also possible to obtain molecules useful as a lead compounds for synthetic drugs with similar activity to that of the original.

The theoretical contents of this subject are aligned with the Sustainable Development Goals (SDG) 3

(Health and Well-Being), 4 (Quality Education) and 15 (Life on Land) of the United Nations 2030 Agenda and have been organized following a **biogenetic-chemical criterion** for the classification of the most common chemical groups of drugs. At the beginning, some basic general topics are proposed for the understanding of the contents, which facilitate the achievement of the objectives (SDG) and skills to be achieved with the learning of this subject. In these units the multidisciplinary nature of this subject will be evident through the connections with more or less closely related, previously studied, matters (Plant Physiology, Botany, Physiology, Organic Chemistry, Analytical Chemistry, Biochemistry, Microbiology) and with other disciplines that will be simultaneously studied along the same academic year (Pharmaceutical Chemistry, Pathophysiology, Pharmacology I, etc.)

The theoretical aspects are supplemented by laboratory practice, in them the students implement certain SDGs (SDG 5, 11, 12 and 13) acquiring skills in the basic techniques in a Pharmacognosy's laboratory by carrying out experimental studies on some of the concepts developed in the lectures.

PREVIOUS KNOWLEDGE

RELATIONSHIP TO OTHER SUBJECTS OF THE SAME DEGREE

There are no specified enrollment restrictions with other subjects of the curriculum.

OTHER REQUIREMENTS

It is suggested to have knowledge of Botany, Organic Chemistry, Analytical Techniques, Instrumental Techniques and Physiology.

COMPETENCES / LEARNING OUTCOMES

-

Acquire the ability to design the most appropriate extraction and purification method for isolating the active ingredients of a drug, as well as apply spectroscopic techniques to elucidate their structure.

Act with autonomy in learning, making informed decisions in different contexts, issuing judgements based on experimentation and analysis, and transferring knowledge to new situations.

Collaborate effectively in work teams, assuming responsibilities and leadership roles and contributing to collective improvement and development.

Contribute to the design, development and implementation of solutions that respond to social demands, taking into account the Sustainable Development Goals as a reference.

Demonstrate critical and self-critical thinking in the field of the degree programme, considering aspects such as professional ethics, moral values and the social implications of the different activities carried out.

Demonstrate understanding of the use of natural products as lead compounds for the development of new drugs.

Develop skills to update knowledge and undertake further studies, including pharmaceutical specialisation, scientific research, technological development and teaching.

Gather and transmit information in English at a level of proficiency equivalent to B1 of the Council of Europe.

Handle products, material and laboratory equipment with precision and safety.

Know and identify raw materials of biological origin (drugs) used for the production of medicines and medicinal plant-based products.

Know and understand, within the field of the degree programme, gender inequalities in society; integrate different needs and preferences based on sex and gender into the design of solutions and problem solving.

Know how to communicate effectively, both orally and in writing, adapting to the characteristics of the situation and the audience.

Know how to interpret, evaluate and communicate relevant data in the different areas of pharmaceutical activity, using information and communication technologies.

Know the bases and stages of analytical control of herbal medicines.

Know the main structural types of secondary metabolites used in drug development and their relationship with biosynthetic pathways.

Know the pharmacological activity of the active principles of those drugs considered most important due to their therapeutic interest.

Learn about the use, efficacy and safety of medicinal plants.

Module: Biology. Develop skills related to the beneficial effects of medicinal plants and understand the health risks associated with their misuse.

Module: Biology. Know medicinal plants: botanical diversity, physiology, use and management.

Module: Chemistry. Identify, design, obtain, analyse and produce active ingredients, medicines and other products and materials of health interest.

Open new perspectives for the development of biotechnology in the research of living beings as sources of new active principles.

Propose creative and innovative solutions to complex situations or problems within the field of knowledge, to respond to diverse professional and social needs.

Recognise one's own limitations and the need to maintain and update professional competence, placing particular emphasis on self-learning of new knowledge based on available scientific evidence.

Transmit ideas, analyse problems and solve them with critical spirit, acquiring teamwork skills and assuming leadership when appropriate.

DESCRIPTION OF CONTENTS

1. Block I. Generalities

UNIT 1. Basic concepts: crude drug, active principle, natural product. Pharmacognosy objectives and its future. Bibliography.

UNIT 2. Source of drug: biodiversity. Obtention. Quality criteria for herbal drugs.

UNIT 3. Biosynthesis of natural products. Primary and secondary metabolism. Main biosynthetic pathways: Precursors. Secondary metabolites biosynthetic classification.

UNIT 4. Isolation and identification of active principles. Extraction. Methods of purification and isolation. Strategies for structural elucidation of natural products.

2. Block II. Study of the active principles of drugs, according to their biosynthetic origin

Derivatives of MONOSACCHARIDES

UNIT 5. Oligosaccharides. Homogeneous and heterogeneous polysaccharides.

ACETATE and SHIKIMATE derivatives, lipids and polyphenols

UNIT 6. Lipids and related compounds. Statins.

UNIT 7. Biosynthesis of the aromatic ring. Coumarins. Lignans: podophyllotoxin and derivatives.

UNIT 8. Flavonoids: rutin, citrus and derivatives. Anthocyanins. Proanthocyanidols. Tannins. Drugs containing these principles.

UNIT 9. Anthracene glycosides. Senna, buckthorn, sacred bark, aloes.

MEVALONIC ACID derivatives: terpenoids

UNIT 10. Biosynthesis of terpenoids. Essential Oils. Iridoids.

UNIT 11. Monoterpene-phenols: cannabinoids.

UNIT 12. Sesquiterpenoids: artemisinin. Diterpenoid: paclitaxel.

UNIT 13. Triterpenes and steroids. Saponins. Saponin-containing drugs. Industrial production of steroidal hormones.

UNIT 14. Cardioactive glycosides. Foxgloves. Digitoxin and digoxin. Other drugs containing cardioactive glycosides: squill, strophanthus.

AMINO ACID derivatives: alkaloids

UNIT 15. Generalities of alkaloids.

UNIT 16. Ornithine derivatives. Tropane alkaloids. Drugs containing tropane alkaloids: deadly nightshade, henbane and thornapple. Atropine, scopolamine and related compounds. Drugs containing pseudotropane alkaloids: coca. Cocaine. Pyrrolidine alkaloid drugs: tobacco.

UNIT 17. Phenylalanine and/or tyrosine derivatives. Phenethylamine alkaloids: ephedrine. Morphinan alkaloids. Opium. Morphine and its derivatives. Aporphinoid alkaloids: boldine. Bisbenzylisoquinoline alkaloids. Menispermaceous curares. Monoterpene isoquinoline alkaloids: emetine. Benzoazepine ring alkaloids: galanthamine. Tropolone ring alkaloids: colchicine.

UNIT 18. Tryptophan derivatives. Lysergic acid alkaloids. Ergot. Ergopeptides and related compounds. Monoterpene indole alkaloids. Vinca. Quinoline alkaloids: quinine, quinidine, camptothecin and derivatives.

UNIT 19. Imidazole alkaloids. Xanthines. Other nitrogenous substances.

3. Laboratory Practices. Analysis and control of herbal drugs

SESSION 1. Basis of analytical control of herbal drugs. Polyphenols containing-drugs: flavonoids of Citrus sp. fruits. Tannins of Thea sinensis leaves.

SESSIONS 2 and 3. Terpenoids containing-drugs: saponins of Glycyrrhiza glabra roots. Cardiac glycosides of Nerium oleander leaves. Essential oils of Matricaria recutita flowers.

SESSION 4. Anthracene glycosides containing-drugs: Cassia sp. leaves.

SESSION 5. Alkaloids containing-drugs: (qualitative analysis). Tropane alkaloids of Atropa belladonna leaves.

SESSION 6. Alkaloids containing-drugs (quantitative analysis). Tropane alkaloids of Atropa belladonna leaves.

SESSION 7. Determination of active compounds in a problem drug: extraction, qualitative or quantitative determination. Written report as a scientific paper including introduction, methods, results and discussion, conclusions and bibliography.

SESSION 8. Oral presentation of written report. Conclusions of laboratory sessions.

WORKLOAD

PRESENCIAL ACTIVITIES

Activity	Hours
Tutorials	4,00
Theory	54,00
Seminar	4,00
Laboratory	28,00
Total hours	90,00

NON PRESENCIAL ACTIVITIES

Activity	Hours
Attendance at other activities	3,00
Individual or group project	30,00
Independent study and work	75,00
Preparation of lessons	22,00
Preparation for assessment activities	3,00
Resolution of case studies	2,00
Total hours	135,00

TEACHING METHODOLOGY

The matter is structured in order to the student will be the protagonist of their own learning.

***Theoretical classes.** Students must reinforce the basic knowledge included on the program through self-study and class assistance. Before the end of class the teacher will consider a number of questions that can be answered by students and, with them, focus the most important concepts of the unit and other aspects of particular complexity.

After each block of units, a summary will provide to the students the ability to relate the contents of different units. To encourage active student participation, the teacher will alternate the above methodology with case studies, problem solving, analysis of readings, press notes etc.

In the individual study, and in the preparation of the units in depth, the teacher will show students the adequate literature and provide the necessary support material.

***Laboratory practice.** Labs are structured in 8 sessions of 3.5 hours each, four in the first semester and four in the second one. The student has to complete a pre-laboratory assistance consisting in the understanding of the script of practice, the review of the theoretical concepts involved and the preparation of a scheme of the working process. At the beginning of each session, the teacher will report the most important aspects of experimental work, promoting knowledge and attitudes in favor of the prudent and sustainable use of solvents (SDG 12 and 13) and other chromatographic elements and will assist to the student during the session. Once the corresponding practice was made, the student will analyze the observed facts and solve some questions proposed by the teacher at the beginning of the session or during the course of practice. In the seventh session, a drug problem will be give on which the teacher raise a number of questions. Each student will plan using the practice outlines, his lab notebook and appropriate manuals. After the implementation of the proposed plan, a report, in a scientific paper format, will be delivered and exposed to the other students in the last session, for a maximum period of 15 minutes. Then a time of debate about reasoning, methodological aspects, interpretation given to the results and conclusions reached, will be open. The teacher may assess the realization by pairs.

***Tutorials.** The tutorials are organized in small groups of students, according to the timetable established by the Faculty (two sessions in each semester). In them, the teacher will evaluate the process of student learning in a globalized manner. Similarly, in the tutorial students will be advised about the strategies to follow in order to avoid the difficulties that they may have. The teacher may propose an individual or collective specific questions according to the needs of students that will be analyzed and discussed on the date by mutual agreement.

***Seminars.** They consist of the preparation and exposure to other students of a work carried out by subgroups of four or five students about a subject of Pharmacognosy or about a multidisciplinary subject (SDG 17) proposed by several teachers. In these seminars, students will exercise the search of information, the ability to outline and summarize as well as oral and written expression, promoting teamwork and provide the knowledge and attitudes to implement the SDGs in their professional future. The theme and date of exposure will be established at the beginning of course in coordination with the other matter.

***Other activities.** These classroom activities are aimed at the search and projection of videos, films and/or documentaries related to the subject, as well as the realization by subgroup of three or four students of different games with questions of increasing difficulty, in order to obtain information about their teaching-learning process.

EVALUATION

In the evaluation of student learning, all aspects described in the methodology section of this guide will be considered and evaluated continuously by the teacher.

10% of the qualification (1.0 point): the result of the preparation and presentation of work in the seminars.

20% of the qualification (2.0 points): the qualification of the practical sessions, which will be of compulsory assistance. The score will take into account the participation (10%), performance in the laboratory (30%) and the mark of the practical exam (60%). In case a student fails the subject the year that they were taken, the score obtained will be applicable to only the consecutive year.

65% of the qualification (6.5 points): the results obtained in the exams. The two exams will be performed in the periods established by the Faculty: January 2026 (First Semester), May and June 2026 (Second Semester and Final Exam). Except units 1-4, the rest of theoretical contents corresponding to the first part will drop off for the second one. Both exams will consist in a series of questions that require students to relate aspects discussed in various units or even complementary aspects studied in other matter. It may also include a theme to develop, which can demonstrate the ability to synthesize and written expression acquired by the student.

5% of the qualification: (0.5 points): will be from the direct evaluation of the teacher with the student, in the various forms of programmed learning. It will take into account different aspects such as **participatory** assistance, progress in the use of language characteristic of matter, critical thinking, ability to work in groups, etc.

Evidence of copying or plagiarism in any of the assessable tasks will result in failure to pass the subject and in appropriate disciplinary action being taken. Please note that, in accordance with article 13. d) of the Statute of the University Student (RD 1791/2010, of 30 December), it is the duty of students to refrain from using or participating in dishonest means in assessment tests, assignments or university official documents.

In the event of fraudulent practices, the **¿Action Protocol for fraudulent practices at the University of Valencia¿** will be applied (ACGUV 123/2020): <https://www.uv.es/sgeneral/Protocols/C83sp.pdf>

In any case, to pass the course is necessary to obtain a positive evaluation (5 out of 10 points) in each of the semesters and laboratory practices.
