SUMMARY

Objectives: To acquire basic knowledge of mathematics in the area of algebra and geometry, essential for studies in Physics.

Descriptor of the subject in the curriculum (Algebra and Geometry I and II): Complex numbers. Algebraic structures. Vector spaces. Matrices and determinants. Systems of linear equations. Linear operators. Diagonalization. Euclidean geometry. Tensors.

Relationship with other materials prior, concurrent and future: instrumental course, a primary to study physics in any of their specialties. Complementary to other subjects of Mathematics and Mathematical Methods.

I Methods.

PREVIOUS KNOWLEDGE

RELATIONSHIP TO OTHER SUBJECTS OF THE SAME DEGREE

There are no specified enrollment restrictions with other subjects of the curriculum.

OTHER REQUIREMENTS

Secondary school Mathematics:

Vector spaces. Matrices. Determinants. Linear equation systems. Vectors. Geometry. Metric problems. Successions and numerical series. Function limits. Continuity. Derivatives. Taylor developments. Integration.

COMPETENCES / LEARNING OUTCOMES

1105 - Degree in Physics

Be able to understand and master the use of the most commonly used mathematical and numerical methods.

Communication Skills (written and oral): Being able to communicate information, ideas, problems and solutions through argumentation and reasoning which are characteristic of the scientific activity, using basic concepts and tools of physics.

Foreign Language skills: Have improved command of English (or other foreign languages of interest) through: use of the basic literature, written and oral communication (scientific and technical English), participation in courses, study abroad via exchange programmes, and recognition of credits at foreign universities or research centres.

Modelling & Problem solving skills: be able to identify the essentials of a process / situation and to set up a working model of the same; be able to perform the required approximations so as to reduce a problem to an approachable one. Critical thinking to construct physical models.

Students must be able to apply their knowledge to their work or vocation in a professional manner and have acquired the competences required for the preparation and defence of arguments and for problem solving in their field of study.

Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences.

Students must have acquired knowledge and understanding in a specific field of study, on the basis of general secondary education and at a level that includes mainly knowledge drawn from advanced textbooks, but also some cutting-edge knowledge in their field of study.

Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.

Students must have the ability to gather and interpret relevant data (usually in their field of study) to make judgements that take relevant social, scientific or ethical issues into consideration.

To know how to apply the knowledge acquired to professional activity, to know how to solve problems and develop and defend arguments, relying on this knowledge.

DESCRIPTION OF CONTENTS

1. Complex numbers

The need for complex numbers. Manipulation of complex numbers (Addition and subtraction. Product of complex numbers. Complex conjugate. Division). Polar representation and basic algebraic operations (Modulus and argument of complex numbers. Polar representation. Product and division in polar form). Roots, powers and logarithms of complex numbers. Trigonometric and hyperbolic functions.

2. Algebraic structures

Internal composition laws (Definition and properties). Groups (Definition. Abelian groups. Subgroups). Group homomorphisms. Group of permutations. Rings. Fields (\mathbb{R} and \mathbb{C}).

3. Vector spaces

Vector space (Definition. Consequences and direct theorems). Vector subspaces (Definition. Characterization theorem. Subspace intersection. Direct sum of subspaces). Linear combinations (Definition. Systems of linearly independent vectors). Basis of a vector space (Definition. Vector components. Finite and infinite dimension).

4. Linear applications

Linear application (Definition. Properties). Classification. Operations with linear applications (Sum. Multiplication by a scalar. Application composition). Projectors (Definition. Properties). Dual Space (Definition. Linear forms. Dual base).

5. Pre-Hilbert spaces

Pre-Hilbert space (Scalar product. Properties). Norm (Schwarz and Minkowski inequalities). Orthonormal systems (Orthonormal basis. Gram-Schmidt orthonormalising process). Orthogonal subspaces (Definition. Orthonormal projection and projectors). Examples (\mathbb{R}^n , \mathbb{C}^n , l^2 , $L^2[a,b]$). Fourier expansions. Orthogonal polynomials).

WORKLOAD

PRESENCIAL ACTIVITIES

Activity	Hours
Tutorials	15,00
Theory	45,00
Total hours	60,00

NON PRESENCIAL ACTIVITIES

Activity	Hours
Attendance at other activities	0,00
Individual or group project	15,00
Independent study and work	65,00
Preparation of lessons	0,00
Preparation for assessment activities	10,00
Resolution of case studies	0,00
Total hours	90,00

TEACHING METHODOLOGY

Contact teaching (40%)

Theoretical and practical classes: It addresses the conceptual and formal matter and resolution of problems or cases as the application of theoretical concepts. They are based on lectures and mainly the use of dialogued teaching tools as graphical representation of solutions, design presentations, etc.

Group tutoring sessions in small working groups, focused on active student participation: dealing with doubts in theoretical concepts and problem solving, reinforcement in areas of greatest difficulty, conceptual questionnaires, experimental demonstrations relevant to studied cases, and associated with an ongoing evaluation and monitoring the student's progress in the field.

Student's Personal work (60%):

- Study of the theoretical concepts.
 - Resolution of exercises and problems, individually and in groups.
 - Individual tutorials: questions addressed to the teacher on difficulties encountered in the study and resolution of problems or discussion on topics of interest, bibliography, etc.
- ntered in the study and resolution of problems or discussion on topics of interest, bibliography, etc.

EVALUATION

The assessment system, for both examination calls,

- 1) Written examinations: One part will assess the understanding of the theoretical-conceptual and formal

nature of the subject, both through theoretical questions, conceptual questions and numerical or simple particular cases. Another part will assess the applicability of the formalism, by solving problems and critical capacity regarding the results. Proper argumentations and adequate justifications will be important in both cases. The minimum mark to be got in each of the parts to pass the course is 3/10. At the same time, the minimum overall exam grade to average with the continuous evaluation grade (see point 2) is 4 out of 10.

2) Continuous assessment: assessment of exercises and problems presented by students, questions proposed and discussed in class, oral presentation of problems solved or any other method that involves an interaction with students.

3) The final mark will be the maximum of the examination mark and the examination mark weighted with the mark of the continuous assessment, with a 30% weight for the continuous assesment (and 70% for the exam).

COMMENTS: Subject to compliance with the compensation criteria established for this purpose, note this course can be averaged with others belonging to the same matter, so as to pass the course.
