**SUMMARY**

"MATHEMATICS II" is a compulsory six-month basic subject that is taught in the first year, second semester, of the Degree in Finance and Accounting.

In this subject the basic concepts and techniques of mathematical optimization are developed with the objective of providing the student with the appropriate mathematical tools in order to deal with the problem of assigning scarce resources to different alternative uses. Mathematical optimization techniques are needed to approach the theory of the firm, consumer theory, growth models, etc. Thus, the first topics of this subject introduce terminology and basic concepts of optimization. In the following topics, this knowledge is expanded and resolution techniques are developed so that, when faced with a real practical situation, the student knows how to formulate it, solve it, and interpret the obtained results.

Once the basic concepts have been introduced, non-linear programming is approached as the most general optimization problem, where interesting particular cases are addressed, such as unconstrained problems, problems with equality constraints (classical programming), and problems with non-negative variables, as well as the general case with constraints defined by inequalities. From topic 3, linear programming is addressed, where the fact that all the functions are linear allows the use of efficient methods different from those presented for the general case. The linearity also allows analyzing the solution of the problem in a more complete way, by means of sensitivity analysis. The special case in which the problem variables can take only integer values is studied in the last topic.

The relevance of these problems and their frequent appearance in the economics and business world make the capacities for abstraction, synthesis, and analysis for the proper assessment of the situation and the problem statement, as well as the knowledge of the resolution and analysis methods, fundamental skills that a good graduate in Finance and Accounting must possess and that, in addition, are highly valued in the labor market.

This version is a translation of the original Spanish version, which was the one approved by the Department. Hence, the latter will have priority in case there were any difference of interpretation.

## PREVIOUS KNOWLEDGE

## RELATIONSHIP TO OTHER SUBJECTS OF THE SAME DEGREE

There are no specified enrollment restrictions with other subjects of the curriculum.

## OTHER REQUIREMENTS

The knowledge corresponding to the subject Mathematics I is taken for granted. This knowledge includes: basic concepts of analysis (among them, partial derivatives calculation, gradient vector and Hessian matrix), graphical representation with two variables, and calculation of the inverse of a matrix.

## COMPETENCES / LEARNING OUTCOMES

-

Aplicar los principios del análisis económico al diagnóstico y resolución de problemas.

Conocer el lenguaje matemático y el razonamiento lógico-deductivo en la formulación de los fenómenos económico-empresariales.

Conocer y comprender las herramientas matemáticas básicas para la descripción, análisis y toma de decisiones financieras y empresariales.

Uso de los programas Informáticos básicos.

## DESCRIPTION OF CONTENTS

### 1. Introduction to Optimization

Introduction: the problem and its parts. Basic concepts: feasible solution, classes of optimum and classification of problems. Convexity. Basic theorems. The modeling process. Syntax of the computer program.

## 2. Nonlinear Programming

Introduction. Kuhn-Tucker conditions. Basic theorems of non-linear programming. Interpretation of K-T multipliers. Modeling, interpretation and computer resolution of non-linear programming models: existence and globality of the solution and interpretation of the multipliers.

## 3. Introduction to linear programming

The linear problem: Types of solutions. Basic feasible solutions. Fundamental theorems of Linear Programming. Modeling, computer resolution and interpretation of linear programming models. Advanced syntax of the computer program.

## 4. The simplex method

Introduction. Simplex algorithm. Modeling, computer resolution and interpretation of linear programming models: type of solution and interpretation of the reduced cost.

## 5. Sensitivity analysis and post-optimization

Introduction. Sensitivity and post-optimization of the coefficients of the objective function and the right-hand sides of the constraints. Introducing new variables. Modeling and computer resolution of linear programming models: sensitivity analysis.

## 6. Integer Linear Programming

Introduction. General formulation of integer linear problems. Branch-and-bound method. Modeling, computer resolution and interpretation of integer linear programming models.

### WORKLOAD

#### PRESENCIAL ACTIVITIES

Activity	Hours
Theory	30,00
Computer classroom practice	30,00
<b>Total hours</b>	<b>60,00</b>

#### NON PRESENCIAL ACTIVITIES

Activity	Hours
Attendance at other activities	0,00
Individual or group project	9,00

Independent study and work	15,00
Preparation of lessons	35,00
Preparation for assessment activities	31,00
Resolution of case studies	0,00
<b>Total hours</b>	<b>90,00</b>

## TEACHING METHODOLOGY

### *Theory classes:*

The teacher will highlight the main aspects and those more difficult to understand, solve exercises and guide the students learning by means of the materials available in the virtual classroom and the reference manuals. After the class, the materials needed for the next class will be indicated, so that students can prepare for the session.

### *Practical classes:*

Practical classes will primarily address issues related to modeling, computer resolution and interpretation of the results obtained, applying all relevant theory. Previously, the teacher will solve some models and propose some others for subsequent classes. In each class, students should be able to defend the adequacy of its own model and to take decisions in the light of the results.

Theoretical and practical classes are completed with the proposed individual and/or group exercises in which the students will model problems in the area of economics and business, solve them with the computer and interpret their solutions.

## EVALUATION

### **a) Continuous assessment (5 points)**

It is based on the student's attendance, participation and involvement in the teaching-learning process and in the practical activities carried out by the student during the semester, including individual and group work, and the defense of the positions developed by the student.

It consists of the study of practical cases, their mathematical modeling, their resolution with computer and the interpretation and discussion of the results obtained and, if appropriate, it can also contain theoretical-practical exercises.

### **b) Final exam (5 points)**

The final exam will consist of solving theoretical-practical problems.

To pass the subject it will be necessary to obtain at least 2 points in the final exam, at least 2 points in the continuous assessment, and the sum of both marks must be at least 5 points. If the student does not reach the minimum required mark in one of the parts, the final mark will not be greater than 4.5.

In the first call and, if necessary, in the second one, the student will have to take the final exam (5 points). Voluntarily, on that same date, he/she will be able to take a retake exam (5 points) corresponding to the contents of the continuous assessment.

In both calls, in order to retake the continuous assessment, the teacher may require the student to request it by email at least 5 days in advance.
