SUMMARY

Sustainable Chemistry or Green Chemistry is the orientation of chemistry, as a set of theoretical and applied knowledge, whose specific objective is the prevention of environmental contamination and risks due to chemical substances, by introducing or promoting clean and safe production processes, and less toxic and polluting chemical products, without undermining their contribution to well-being and technological progress.

Sustainable Chemistry must be considered as a part of Environmental Chemistry and endeavours to achieve the current and future prevention of contamination and risk problems originated by chemical substances, by analysing the origin of these problems. With the premises, the objectives of Green Chemistry are the following:

Reducing the generation and use of contaminants in the chemical process

Reducing the risky character of the chemical process

Reducing the noxious effect of the chemicals used by the production sectors or the final consumer.

Reducing the use of extinguishable and scarce raw materials.

PREVIOUS KNOWLEDGE

RELATIONSHIP TO OTHER SUBJECTS OF THE SAME DEGREE

There are no specified enrollment restrictions with other subjects of the curriculum.

OTHER REQUIREMENTS

Chemistry knowledge acquired during the Chemistry Degree are required.

COMPETENCES / LEARNING OUTCOMES

2249 - Master's Degree in Chemistry

Apply the advanced theoretical and practical knowledge gained in the different specialties of chemistry to R&D and innovation.

Be able to design, conduct, analyse and interpret complex experiments and data, as a specialist.

Be able to solve complex chemistry problems, whether in the academic, research or industrial application areas at a specialization or masters-level.

Possess the necessary skills to develop multidisciplinary activities within the field of chemistry at the master's level.

Students should apply acquired knowledge to solve problems in unfamiliar contexts within their field of study, including multidisciplinary scenarios.

DESCRIPTION OF CONTENTS

1. Introduction

Objectives. Use of renewable sources of raw materials. Reduction of polluting substances: chemical substances (Atomic economy, Factor E) and energy.

2. Use of renewable sources from raw materials

Chemical products from glucose. Chemicals from fatty acids. Polymers from renewable sources. Other products from renewable sources.

3. Sustainable Process Design and Industrial Examples

Factors to consider for the design of a sustainable process. Complete study. Industrial examples.

4. Renewable energy sources

Main renewable energy sources. Solar, eolic, hydroelectric and biomass. Other renewable energy sources. Energy storage systems.

5. Recycling

Waste recycling: paper, plastics, glass, batteries, common metals (Al, Pb,...), scarce metals (Au, Rh, Pd, Ta,...),...

6. Enviromental pollution: solutions provided by chemistry

Introduction to the main problems of environmental pollution: global warming, photochemical smog, ozone layer and acid rain. Contributions of chemistry to their resolution.

7. Catalysis: green concepts and applications

Basic concepts of catalysis. -Catalysis and Green Chemistry. -Influence of catalytic processes in the E-factor and atomic efficiency. -Examples of the role of catalytic processes in Q.V. : Catalysis by acids and bases. Oxidation and catalytic reduction. Catalytic formation and C-C bonds. Enantioselective catalysis.

8. Biocatalysis and biotechnology

Biocatalysis. - Renewable materials and white biotechnology. -Integration of processes and catalytic cascades. -Catalysis for a green industry

WORKLOAD

PRESENCIAL ACTIVITIES

Activity	Hours
Tutorials	6,00
Theory	21,00
Seminar	3,00
Total hours	30,00

NON PRESENCIAL ACTIVITIES

Activity	Hours
Attendance at other activities	0,00
Individual or group project	10,00
Independent study and work	25,00
Preparation of lessons	0,00
Preparation for assessment activities	10,00
Resolution of case studies	0,00
Total hours	45,00

TEACHING METHODOLOGY

The subject will be taught in asynchronous online mode. Among other training activities, the resolution of applied practical problems will be proposed, aimed at evaluating the student's understanding of the subject. The course will take place through the Virtual Classroom platform, a virtual space in which the teachers will post all the appropriate materials for the development of teaching and the control of student participation in the proposed activities,.

The continuous assessment will include the discussion of theoretical and practical questions in the virtual forums and in the tutorial sessions, as well as the conduction and submission of activities throughout the course about the different aspects studied in the subject.

EVALUATION

The evaluation of the subject will consist of the following sections:

1. Continuous assessment of the teachers (20% of the grade). Throughout the course there will be questionnaires and evaluable activities on each of the topics. In this assessment, different aspects will be taken into account:

- Resolucion of exercises and raising questions
- Critical spirit
- Resolucion of the proposed activities

2. Presentation of tasks (30% of the grade). In addition to the questionnaires by topic of the continuous assessment, the teacher will propose other activities that must be submitted through the virtual classroom within the established periods. These activities may include, if considered appropriate by the teachers, the participation in a seminar or online talk and completion of related questionnaires.

3. Presential oral exam (50% of the grade). The exam will consist of an oral presentation followed by a discussion with the teachers. The guidelines for the oral exam and for the choice of topic will be announced at the beginning of the course. Both the choice and presentation of the topic, as well as the theoretical knowledge of content related to the subject will be assessed. The exam will be of such a nature that it will

compel the student to relate aspects that appear in different topics of the subject (and, even, in other subjects).
